Use of hanit material in interior areas

Dear Sirs,

Dear Madams,

Our hanit material is designed for outdoor use. However, there are no risks or disadvantages associated with indoor use. We would like to point out that hanit has a characteristic odour, which dissipates more slowly indoors than outdoors. Based on current knowledge, there is no health risk, as the raw materials for hanit, post-consumer waste e.g. food packaging, are used for production. Proof such as food authenticity and testing of ingredients can be provided if required. When used indoors, the fire behavior of hanit should also be taken into account.

i.V. Jan-Philipp Effgen
